Airtable 11
Update a Record
Setting the variable name for running the next batch of certificates
Selecting the value of the variable e.g. selecting the next batch
Has to be an integer
Selecting the record from the certificate-batches table that has the batch number we selected in the first step
The record we fetch will have a list of nc-submissions to mint certificates for we have to iterate over that list
We are going to fetch each individual submission by their ID
We will fetch the NCD session they attended to get host and date information
We will use the information from both the submission and schedule records to send the certificate data to our minting
We use the email address from the submission to send the notification email about their certification
We form the subject based on the name of the submission creator and the program name for which they submitted
The actual email body formed from submission, schedule and minting data
Reply to address, so we don't receive replies to one email address but to a group
We exclude the submissions which already have their certificate minted
We use the submission ID to select the record to update
This is the only field we update, namely the certificate-minted field which signifies that this person already received their certificate
